

WAMBE

Africa's Digital Celebration Platform

Founder-Grade Product Strategy, Business Model, MVP and Technical Paper

Prepared for: Ammar Jubril and Abdullah Zubair | June 2026

1. Executive Summary

Wambe is not merely an event-listing app. It is a culturally-native celebration operating system for Nigerian and African social gatherings.

Wambe is a mobile-first platform for digitizing Owambe-style gatherings, weddings, birthdays, naming ceremonies, graduations, religious gatherings, public parties, concerts, campus events and private celebrations. It gives every celebration a digital home: invitation card, location, map, dress code, RSVP, guest list, digital pass, reminders, ticketing, Aso-Ebi visualization, vendor marketplace and memory vault.

The core wedge is simple: hosts upload an invitation card and Wambe turns it into a beautiful event page that can be shared on WhatsApp, Instagram, SMS or through a direct link. Guests can open the link, RSVP, view the embedded map, understand dress code, access the digital pass, and receive updates. This creates a strong viral loop because every event page naturally distributes Wambe to hundreds of guests.

The long-term opportunity is larger than invitations. Wambe can own the commercial layer around celebrations: vendor discovery, ticketing fees, premium pages, event registries, sponsored placements, fashion technology, venue discovery and event-commerce partnerships. The product should begin with private celebrations because they already have urgent sharing needs, then expand into public event discovery once supply and trust are established.

The document recommends a focused MVP: digital invitation pages, RSVP, maps, event details, dress code/Aso-Ebi uploads, QR pass and host dashboard. AI Aso-Ebi Studio should be positioned as a differentiated premium module, but not allowed to delay the first launch.

Strategic decision	Recommendation
Beachhead	Weddings, birthdays and Owambe-style weekend gatherings in Lagos, Abuja, Ibadan, Ilorin and major campuses.
MVP promise	Create a beautiful event page in less than 3 minutes and share one trusted Wambe link.
Monetization first	Premium event pages and QR access control before broader marketplace revenue.
Long-term moat	Culture-specific workflows, social graph, event data, vendor supply, AI fashion previews and trust signals.

2. Founder Thesis

Africa has digitized payments and transportation. Celebrations remain largely analog, informal and fragmented.

The core founder thesis is that celebration culture is one of the most consistent offline behaviors in Nigeria. Every weekend, Nigerians attend weddings, birthdays, naming ceremonies, religious gatherings, alumni hangouts, club nights and family events. Yet the coordination stack remains mostly WhatsApp messages, printed cards, image flyers, separate map pins and manual calls.

This creates a rare consumer-technology wedge. Wambe does not need to persuade Africans to celebrate. The behavior already exists. The product simply needs to become the easiest digital layer around an existing habit. If the product succeeds, the phrase “send me the Wambe link” can become a social behavior similar to “send me the Zoom link” for meetings.

The most important insight is that the product should not copy Eventbrite. Ticketing is only one layer. African celebrations have different workflows: Aso-Ebi, dress codes, family access, private links, venue pins, gift details, guest approval, gate management, photo memories and vendor referrals. Wambe should therefore be designed from African social realities upward, not imported from Western conference software downward.

The strongest possible version of Wambe becomes an operating system for celebrations. It starts with digital invitations. It expands into access control. It then becomes a marketplace where hosts meet vendors and guests discover events, fashion inspiration and memories.

Product truth: The invitation page is the acquisition product. The vendor marketplace is the profit product. The event graph is the long-term moat.

3. Market Context and Timing

The macro case is supportive: event spending is large, mobile-first behavior is normal, and AI can now create culturally-specific experiences.

The global events and wedding sectors are large and growing. Industry reports estimate the global event industry in the trillion-dollar range and project continued growth through 2030 and 2035, while the global wedding services market is also projected to grow strongly over the next decade. These global numbers should not be used as direct proof of Wambe's obtainable market, but they validate that celebrations and events are a serious commercial category.

Nigeria also has a visible and commercially active event ecosystem. Public reporting on Nigeria's event sector emphasizes high yearly activity in cities such as Lagos and Abuja, especially around weddings, corporate functions and social gatherings. Event planning costs alone can run into hundreds of thousands or millions of naira for sizable weddings, which indicates a meaningful willingness to pay around organized celebrations.

The timing is attractive for four reasons. First, WhatsApp link-sharing has already trained users to open event links. Second, payments through Paystack, Flutterwave and bank transfers make ticketing and premium pages easier. Third, Google Maps usage is now normal for venue navigation. Fourth, AI image generation enables fashion preview features that would have been technically expensive a few years ago.

The market is still execution-heavy. Consumer adoption will not be won by research alone. Wambe must create a practical product that is faster than designing a flyer, easier than a Google Form, and more beautiful than a plain WhatsApp message.

Signal	Implication for Wambe
High frequency of social events	Recurring use cases create repeated acquisition opportunities.
Event coordination remains fragmented	A single trusted link solves a visible pain.
Existing ticketing tools focus on public/corporate events	Wambe can differentiate through private celebrations and cultural workflows.
AI image tools are now usable	Aso-Ebi Studio becomes a defensible culture-native feature.

Sources used for market context include 6Wresearch on Nigeria event-management growth, BusinessDay reporting on Nigeria event-sector activity, Connect Nigeria pricing data for wedding planners, SNS Insider and Technavio event-industry reports, and market reports on wedding services. See Sources Appendix.

4. Customer Problem

Wambe should solve a real weekend pain: “I have been invited, but everything I need is scattered.”

For guests, the current experience is often messy. They receive a card image on WhatsApp, then a separate Google Maps link, then an Aso-Ebi image, then a reminder from the host, then another message about timing or parking. When they arrive at the venue, they may need to prove they were invited or search old messages for the actual event hall.

For hosts, the problem is even larger. They need to know who is coming, share updates, reduce gate-crashing, communicate dress code, handle ticketing when relevant, and coordinate vendors. Most hosts do this manually through WhatsApp groups, calls, image flyers and spreadsheets.

For vendors, the event economy is demand-rich but discovery-poor. Photographers, decorators, MCs, caterers, venues, makeup artists and tailors rely heavily on referrals and Instagram visibility. Wambe can become a lead channel because every event page sits next to intent: someone is planning an event and needs services.

User	Pain	Wambe response
Host	Too many manual messages and uncertain attendance.	Event page, RSVP dashboard, guest list, reminders and QR passes.
Guest	Information scattered across messages and images.	One link with card, map, dress code, time, pass and updates.
Vendor	Discovery depends on referrals and social media luck.	Marketplace listing, sponsored placement and conversion tracking.
Event planner	Manual coordination across vendors and guests.	Planning dashboard, guest analytics and vendor workflow tools.

The key product standard should be this: a guest should be able to understand the event in 15 seconds and navigate to the venue in one tap. A host should be able to create the event in less than 3 minutes and share it immediately.

5. Target Segments and Beachhead

Start narrow. Win private celebrations first, then expand into public event discovery.

Wambe has many possible use cases, but the first version should not try to serve everyone. The recommended beachhead is private and semi-private celebrations: weddings, birthdays, naming ceremonies, anniversaries, graduations and housewarming events. These use cases already involve invitation cards, venue details, dress code and guest coordination.

The second segment is public social events: club nights, beach parties, concerts, campus events, cultural shows and networking events. This segment supports ticketing and event discovery, but it requires more supply, marketing and trust. It should follow once Wambe has enough users and event organizers.

The third segment is institutions: alumni associations, religious groups, universities, communities, professional bodies and corporate social events. These groups can become recurring accounts and create subscription revenue later.

Priority	Segment	Why it matters	Launch approach
1	Weddings and Owambe	High guest count, strong need for directions, dress code, RSVP and passes.	Partner with wedding planners, photographers and MCs.
2	Birthdays and private parties	Frequent, simpler events, viral guest invites.	Free pages plus paid themes and passes.
3	Campus and youth events	Fast sharing, social discovery, public listings.	Ambassador programs in universities.
4	Concerts and club events	Ticketing revenue and featured listings.	Partner with promoters after MVP stability.
5	Vendors and venues	Marketplace monetization.	Recruit once event demand is visible.

A practical launch city strategy is Lagos first, then Abuja and Ibadan, with opportunistic expansion into Ilorin, Abeokuta, Port Harcourt and campus communities where social events travel quickly through student networks.

6. Product Positioning

Position Wambe as the digital home for celebrations, not as another ticketing app.

The simplest positioning statement is: Wambe helps hosts create beautiful digital invitations with RSVP, maps, dress code and digital passes for African celebrations.

For public-facing branding, Wambe should sound joyful and culturally native. The product language should feel close to Owambe without limiting itself only to Yoruba or wedding culture. The name is short enough to become a verb or noun in conversation: “Create a Wambe,” “Send the Wambe link,” “Check the Wambe pass.”

The product should avoid a corporate software feel. It must feel premium, festive, mobile-first and social. However, the host dashboard should still be operationally serious: guest count, RSVP status, pass scans, map views, and analytics.

Audience	Positioning line
Couples	Your wedding invitation, map, RSVP and guest pass in one beautiful link.
Birthday hosts	Create your party page and know who is coming.
Guests	Never lose the invitation, location or dress code again.
Event planners	Manage guests, updates and access from one dashboard.
Vendors	Meet customers at the moment they are planning celebrations.

Suggested tagline: “Every celebration deserves a digital home.” Alternative: “Plan. Invite. Discover. Celebrate.”

7. Product Principles

The first product must be beautiful, fast, trustworthy and culturally intelligent.

Wambe should be built around five principles. First, it must be faster than WhatsApp chaos. Hosts should create and share an event quickly. Second, the event page must be beautiful enough that people are proud to share it. Third, trust must be built into private events through invitation links, approvals and QR passes. Fourth, the product must respect local celebration practices such as Aso-Ebi, dress code, family invites and multiple event days. Fifth, the business model must monetize value-added layers without blocking virality.

Principle	Product implication
Mobile-first	Most creation, sharing and viewing will happen on phones.
Share-first	Every event must produce a beautiful shareable link and image preview.
No forced app install at first	Guests should access event pages via browser to reduce friction.
Host control	Hosts decide public/private visibility, approval rules and location privacy.
Cultural workflows	Aso-Ebi, dress code, gift info, family access and event schedules are first-class fields.
Trust by design	QR passes, link controls, guest approval and reporting tools.

A key strategic decision: the app should allow guests to open event pages without downloading the app. The app becomes valuable for hosts, repeat guests, vendors and power users, but the first viral loop should not be blocked by installation friction.

8. Core User Journey - Host

The host journey must reduce event setup to a beautiful three-minute flow.

The host creates an account, taps “Create Wambe,” selects an event type, uploads the invitation card, enters event title, date, venue, dress code, visibility and guest rules, then publishes a shareable link. The system should generate a preview card for WhatsApp and Instagram sharing.

For paid or premium events, the host can activate ticketing, QR passes, guest approval and reminders. The MVP should not require hosts to complete every field. Required fields should be minimal: title, date/time, location and visibility. Optional fields include invitation card, Aso-Ebi, gift details, schedule and gallery.

Step	Host action	Product response
1	Select event type	Preloads relevant fields: wedding, birthday, public party, naming ceremony.
2	Upload invitation card	Displays card beautifully and can optionally extract text later.
3	Add venue	Embeds map and gives direction button.
4	Add dress code/Aso-Ebi	Creates fashion section and image gallery.
5	Choose privacy	Public, private link, invite-only or approval required.
6	Publish	Generates Wambe link, QR code and share image.
7	Manage	Host sees RSVPs, pass downloads and guest list.

Key UX metric: first event created in under 180 seconds. If the host cannot create an event quickly, the product loses to WhatsApp.

9. Core User Journey - Guest

Guests should never need to ask: “Where is the venue?” “What is the dress code?” or “Am I invited?”

The guest receives a Wambe link through WhatsApp, Instagram, SMS or email. Opening it shows the invitation card, event title, date, countdown, venue, map, dress code, RSVP button and digital pass. The guest can save the event to calendar, open directions, ask to bring a plus-one if enabled, and receive updates.

For private events, the guest may need to enter a phone number or invitation code. For premium access-control events, a QR pass is generated after RSVP approval. For public events, the guest can buy a ticket and receive a digital pass.

Guest need	Feature
Confirm event details	Invitation page with card, date, time and host message.
Find the venue	Embedded map with one-tap directions.
Know what to wear	Dress code and Aso-Ebi section.
Prove invitation	Digital pass and QR code.
Avoid missing updates	Reminders and host broadcast messages.
Relive memories	Post-event gallery and memory vault.

The guest experience should feel light. Wambe should not demand too many permissions or long registration forms. Phone verification should be reserved for private access, ticketing, pass delivery or RSVP authenticity.

10. MVP Feature Specification

Build the smallest product that delivers cultural value and validates monetization.

The MVP should be scoped around event pages, RSVP, maps, dress code, invitation card upload, sharing, QR pass and host dashboard. These are the features that directly solve the core problem. The AI Aso-Ebi Studio should be prototyped in parallel but released as a premium beta after the base event flow is stable.

Feature	MVP status	Notes for Abdullah
User authentication	Must-have	Email/phone login. Consider OTP for Nigerian phone numbers.
Create event	Must-have	Event type, title, date, venue, visibility.
Invitation upload	Must-have	JPG/PNG/PDF support; compress images for mobile.
Map embedding	Must-have	Google Maps or Mapbox; store coordinates and address.
RSVP	Must-have	Going, maybe, not going; guest name and phone.
Digital pass	Must-have premium	Generate QR tied to guest/event record.
Host dashboard	Must-have	Guest count, RSVP status, share link, scans.
Dress code/Aso-Ebi	Must-have	Image upload, colors, notes, vendor contact optional.
Ticketing	Should-have	Can be phase 1.5 with Paystack.
AI Aso-Ebi	Later beta	Do not block MVP launch.
Vendor marketplace	Later	Requires supply ops and trust system.

Recommended MVP stack: responsive web app first plus mobile-friendly PWA. Native mobile apps can follow after product-market signals. This reduces development time and ensures every invited guest can open the link immediately.

11. Event Types and Data Model

The product must support flexible African event structures: multi-day weddings, private birthdays, paid parties and family gatherings.

Wambe should support multiple event types with shared core fields and optional modules. A wedding may have introduction, Nikkah, traditional wedding and reception. A birthday may only need location, time and RSVP. A concert may need ticketing, seating tiers and check-in. The data model should be modular to avoid building separate products for each category.

Entity	Important fields
User	id, name, phone, email, role, verification status, profile photo.
Event	id, host_id, title, type, description, visibility, start/end time, status, slug.
Venue	event_id, name, address, latitude, longitude, directions note, parking note.
Invitation asset	event_id, file_url, file_type, thumbnail_url, extracted_text optional.
Guest	event_id, user_id optional, name, phone, RSVP status, plus_one_count, approval status.
Pass	guest_id, qr_token, status, issued_at, scanned_at, scan_count.
Dress code	event_id, color_theme, notes, fabric_images, vendor_contact.
Ticket	event_id, tier, price, quantity, sold_count, service_fee.
Vendor	category, location, verified status, portfolio, pricing, rating.

Technical note: separate “guest” from “user.” Many guests will interact through a link without creating a full account. This keeps conversion easy while still allowing later account creation.

12. Privacy and Event Visibility

Privacy is not a side feature. It is central to Nigerian weddings, birthdays and family events.

Wambe needs flexible event visibility. Some events should be public and discoverable. Some should be private but shareable by link. Some should be invite-only and hidden from search. Some should hide location until the guest is approved. The product should allow hosts to decide these rules clearly.

Visibility mode	Use case	Rules
Public	Concerts, open parties, campus events	Visible in discovery, ticketing allowed.
Private link	Birthdays, semi-private weddings	Anyone with link can view; RSVP controlled.
Invite-only	Exclusive weddings, VIP events	Guest must be added or approved.
Hidden location	High-security/private events	Show general area only until approval.
Approval required	Limited capacity events	Guest requests RSVP; host approves before pass.

Privacy controls can become a premium reason to pay. Hosts with high-profile events may value hidden location, guest approval, QR pass and access analytics.

13. Digital Pass and Access Control

The digital pass is a premium trust layer that turns Wambe from invitation page into event infrastructure.

A QR pass solves a direct event problem: gate-crashing, manual guest checking, uncertain attendance and crowd control. Each approved guest receives a unique pass. At the entrance, a host, planner or usher scans it with the Wambe app or web scanner. The pass is marked as used, and the host dashboard updates in real time.

The pass does not need to be complex at first. It can show event name, guest name, QR code, pass status, and optional ticket tier. Later, it can support Apple Wallet/Google Wallet, offline scanning, multiple gate points and staff permissions.

Pass feature	MVP	Later
Unique QR token	Yes	Fraud detection and rotating tokens.
Scan validation	Yes	Offline scan queue.
Guest name display	Yes	Photo verification optional.
Ticket tier	For paid events	Seat/table management.
Multiple gate staff	Basic role	Full access-control team dashboard.
Analytics	Scans count	Arrival curves and capacity forecasting.

Monetization angle: QR pass can sit behind a paid tier because it creates operational value for hosts and planners.

14. Aso-Ebi and Dress Code Module

This is one of Wambe’s strongest cultural differentiators.

Aso-Ebi is not just a fashion detail; it is a social coordination layer. Hosts send fabric images, color themes and vendor instructions to dozens or hundreds of guests. Guests ask repetitive questions about the fabric, color, style and where to sew. Wambe can reduce this friction by giving every event a dedicated Aso-Ebi section.

The base module should allow hosts to upload clear fabric images, add color palette, describe dress code, specify male/female style expectations, add vendor contact and include deadline notes. Guests can view this without asking the host repeatedly.

Field	Purpose
Fabric image	Shows exact cloth or lace sample.
Color palette	Prevents confusion between similar shades.
Style examples	Shows inspiration for male and female guests.
Vendor contact	Links guests to fabric seller or tailor.
Deadline note	Helps guests plan sewing and pickup.
Dress code visibility	Can be visible only to approved guests.

This module should be included in MVP as a simple upload and information section. It is low-cost and high-cultural relevance. The advanced AI simulation should be a premium extension.

15. AI Aso-Ebi Studio

The AI feature should answer one emotional question: “How will this fabric look when worn?”

Hosts can upload a high-resolution fabric photo. Wambe then generates sample outfit previews using stylized avatars or realistic human models. The output can include female styles such as gowns, bubu, iro and buba, and modern party looks; male styles such as agbada, senator wear, kaftan and native attire. The aim is not to replace fashion designers but to provide inspiration and reduce uncertainty.

Version 1 should use generic avatars. Version 2 can allow guests to upload a photo and preview an outfit on themselves, but this requires stronger consent, privacy and image-safety controls. For a teenage or underage user base, personalized body visualization should be handled carefully and age-appropriately; avoid features that encourage body comparison or unrealistic appearance expectations.

Version	Capability	Business model
V1	Host uploads fabric; Wambe generates 6-10 generic outfit previews.	Premium event add-on or per-generation fee.
V2	Guests choose gender-neutral style categories and view avatar-based previews.	Paid style packs and vendor referrals.
V3	Opt-in personalized previews using guest photo with explicit consent.	High-value premium but requires careful privacy controls.
V4	Tailor marketplace connected to generated styles.	Commission on bookings.

Technical note: build this as a separate service/module. Store original fabric image, generated images, generation prompt metadata and usage rights. Do not tie AI releases to the core event page deployment.

16. Public Event Discovery

Discovery should come after Wambe has enough event supply and trust.

Public event discovery is attractive because it can create daily engagement. Users can search for events happening around them by location, date, category, price, music style, crowd type and interest. However, discovery is supply-dependent. If users open the app and find few events, they may churn quickly.

Therefore, Wambe should not launch as an empty discovery marketplace. It should first accumulate private and semi-private events through invitation sharing. Once there are enough public events from promoters, organizers and campuses, discovery becomes more valuable.

Discovery filter	Examples
Location	Lagos Island, Yaba, Ikeja, Abuja, Ilorin.
Time	Tonight, this weekend, next month, December season.
Category	Wedding, birthday, concert, beach party, networking, campus.
Price	Free, RSVP only, paid ticket, VIP.
Vibe	Owambe, Amapiano, tech networking, family, Muslim-friendly, formal.
Trust	Verified host, mutual friends, past event rating.

The first discovery product should be curated, not purely open. A curated “This Weekend on Wambe” feed in Lagos can create quality and reduce spam.

17. Vendor Marketplace

The marketplace is where Wambe can become a serious business beyond invitations.

Every celebration creates vendor demand: venue, photographer, videographer, decorator, caterer, makeup artist, tailor, DJ, MC, planner, security, ushers and transport. Wambe sits at the moment of intent. A host creating an event is likely to need services; a guest viewing Aso-Ebi may need a tailor; a planner managing a wedding may need vendors.

The marketplace should not launch too early as a broad directory. It should begin with categories that directly connect to existing product flows: photographers for memory vault, tailors for Aso-Ebi, venues for maps, decorators/planners for weddings and ticketing/event promoters for public events.

Category	Initial monetization	Trust requirement
Photographers	Sponsored listing, lead fee, commission	Portfolio, reviews, verified past events.
Tailors/fashion designers	Lead fee from Aso-Ebi Studio	Portfolio, location, delivery reliability.
Event planners	Subscription and lead fee	Verification, event history.
Venues	Featured placement and booking commission	Location, capacity, pricing, availability.
Caterers/decorators	Lead fee and commission	Quality checks and ratings.

The marketplace should be trust-led. Bad vendors can damage Wambe's brand, so early marketplace supply should be curated and verified.

18. Business Model Overview

Wambe should monetize hosts, paid events, vendors and brands without weakening viral sharing.

The freemium model is recommended. Basic event pages should be free or very low-cost to maximize adoption. Wambe earns from premium features, ticketing, vendor marketplace, featured listings, registry/gift flows and sponsored placements. The free product should be good enough to spread; the paid product should be valuable enough for serious hosts.

Revenue stream	Mechanism	Potential pricing
Premium event page	Advanced themes, hidden location, guest approval, QR passes, analytics.	■5,000 - ■50,000 per event.
Ticketing fee	Commission/service fee on paid public events.	3% - 8% platform fee plus payment processing.
Vendor marketplace	Lead fees, commissions, sponsored listings.	5% - 15% commission or monthly plans.
Featured events	Promoted placement in city/category feeds.	■10,000 - ■150,000 per campaign.
Gift/registry flow	Guests send gifts through Wambe or linked registry.	1% - 3% transaction fee.
Corporate/institution plans	Recurring accounts for associations, campuses, religious groups.	Monthly/annual subscription.
AI Aso-Ebi Studio	Paid generation packs and premium style galleries.	■2,000 - ■15,000 per event or pack.

Revenue principle: charge where Wambe saves time, increases attendance, improves security, drives sales or helps vendors win customers.

19. Pricing Strategy

Pricing should match Nigerian willingness to pay and event seriousness.

A three-tier pricing model is recommended. The free tier drives adoption. The Plus tier monetizes birthdays and small events. The Premium tier monetizes weddings and serious Owambe events. A separate Pro tier can serve planners and organizers managing multiple events.

Plan	Target user	Features	Indicative price
Free	Casual birthdays and simple private events	Event page, basic RSVP, map, share link, invitation upload.	■0
Plus	Birthdays, housewarming, small ceremonies	Custom themes, reminder, dress code, basic analytics.	■5,000 - ■10,000/event
Premium	Weddings and large Owambe	QR passes, guest approval, hidden location, advanced dashboard, Aso-Ebi gallery.	■20,000 - ■50,000/event
Planner Pro	Event planners and MCs	Multi-event dashboard, team access, vendor tools, exports.	■25,000 - ■100,000/month
AI Style Pack	Fashion-conscious hosts	Fabric-to-outfit previews and downloadable style gallery.	■2,000 - ■15,000/add-on

Pricing should be tested quickly. Nigerians may resist paying before trust is built, so Wambe can initially offer free pages and charge for QR passes, premium themes, private access control and AI style generation.

20. Unit Economics and Financial Model

The model below is an internal planning model, not a forecast guarantee.

The financial model should be assumption-driven and updated monthly after launch. Below is a conservative planning case. It assumes Wambe starts with Lagos-focused private events, converts a small percentage into paid pages, and later adds ticketing and marketplace revenue.

Metric	Year 1	Year 2	Year 3
Hosted events	5,000	25,000	100,000
Paid event conversion	8%	12%	18%
Average paid event revenue	■12,000	■18,000	■25,000
Premium page revenue	■4.8M	■54M	■450M
Ticketing GMV	■20M	■250M	■1.5B
Ticketing revenue at 5%	■1M	■12.5M	■75M
Marketplace/vendor revenue	■1M	■20M	■150M
AI/fashion add-on revenue	■0.5M	■8M	■60M
Indicative gross revenue	■7.3M	■94.5M	■735M

This model is intentionally simplified. It excludes payment processing costs, cloud costs, refunds, customer support, marketing spend, vendor onboarding cost and fraud losses. The point is to show the revenue logic: small fees per event become meaningful when event volume grows and marketplace/ticketing layers mature.

The strongest investor narrative is not Year 1 revenue. It is the compounding network: each event brings many guests, some guests become hosts, hosts need vendors, vendors pay for demand, and public events create ticketing liquidity.

21. TAM / SAM / SOM Thinking

Use transparent bottom-up assumptions rather than exaggerated market claims.

For Wambe, bottom-up sizing is more credible than relying on broad global event-market numbers. The practical obtainable market should be based on number of addressable events, average monetization per event, ticketing GMV and marketplace take-rate.

Layer	Definition	Illustrative assumption
TAM	All celebrations and public events that could use digital invitations, ticketing or vendor discovery across Africa.	Very large, but should be treated as directional.
SAM	Urban Nigeria events with smartphone-using hosts and guests: weddings, birthdays, campus events, public parties and planners.	Core launch market.
SOM	First 3-year reachable market through Lagos/Abuja/Ibadan/Ilorin launch and partnerships.	100,000 hosted events by Year 3 in the planning case.

Example bottom-up formula: annual hosted events x paid conversion x average revenue per paid event + ticketing GMV x take-rate + vendor transactions x commission. This model is more useful for Abdullah and investors because it ties market size to product behavior.

A realistic investor paper should present these as assumptions to validate, not as guaranteed market facts. The first six months of data should refine event creation rate, share rate, RSVP conversion, paid conversion and repeat host behavior.

22. Competitive Landscape

Existing tools validate the category, but Wambe should compete by cultural specificity.

Eventbrite focuses strongly on event creation, ticketing, organizer tools and paid event operations. Luma offers event pages, invitations, registrations, reminders, ticketing and discovery. Partiful focuses on social invitations, RSVP tracking, fun event pages, text blasts and photo albums. These tools validate user demand for event pages and social planning.

However, Wambe's opportunity is to localize deeply for African celebration culture. The differentiation is not "we also do invites." The differentiation is Aso-Ebi, Owambe, private event access, local payment behavior, host/guest trust, Nigerian venue/location realities and a vendor marketplace aligned to celebration spending.

Platform	Core strength	Gap Wambe can exploit
Eventbrite	Ticketing, organizer tools, global event operations.	Less culturally specific to private African celebrations.
Luma	Beautiful event pages, invites, reminders, ticketing and discovery.	Not built around Aso-Ebi, Owambe and Nigerian vendor commerce.
Partiful	Social party invites, RSVP, photo albums and text updates.	Primarily Western social-event context; cultural features are absent.
WhatsApp	Default sharing channel and social graph.	Not structured; no RSVP dashboard, passes, analytics or marketplace.
Google Forms + Maps	Simple data collection and directions.	Fragmented, not beautiful, no celebration UX.

The strategy should be integration, not replacement. Wambe should use WhatsApp as a distribution rail. The enemy is not WhatsApp; the enemy is scattered event information.

23. Go-To-Market Strategy

Wambe should grow through events, not ads alone.

The best acquisition loop is built into the product. One host creates an event page and shares it with 100 to 1,000 guests. Every guest experiences Wambe, and some become future hosts. This viral loop is strongest in weddings, birthdays, campus events and public parties.

The initial go-to-market plan should combine founder-led sales, partnerships and social proof. Wambe should recruit wedding planners, photographers, MCs, decorators, event hall managers and campus ambassadors. These people already sit close to event supply.

Channel	Execution
Wedding planners	Offer free premium pages for first 20 planners in exchange for case studies.
Photographers	Bundle Wambe memory vault with photo delivery.
MCs and DJs	Give referral codes; they mention Wambe during events.
Event halls	Place QR posters: "Create your Wambe link for this venue."
Campus ambassadors	Launch birthday/campus party use cases.
Instagram/TikTok	Show before/after: WhatsApp chaos vs Wambe link.
Influencer weddings	Sponsor digital invitation pages for visible couples.

The first 100 events matter more than the first 10,000 downloads. Wambe should manually support the first hosts, learn every friction point and turn successful events into social proof.

24. Growth Loops and Retention

The product should create network effects through invitations, memories, vendors and event discovery.

Wambe has several possible growth loops. The invitation loop is the first: host creates event, guests open link, guests become future hosts. The memory loop is second: after the event, guests upload or view photos, extending engagement beyond the event day. The vendor loop is third: hosts need vendors, vendors invite more hosts, and successful vendors drive more events onto the platform. The public discovery loop is fourth: users check what is happening around them and organizers list events to reach that audience.

Loop	Mechanism	Metric
Invitation loop	Event link shared to guests.	Guest views per event, host conversion from guests.
RSVP loop	Guests respond and host sends reminders.	RSVP completion rate, reminder engagement.
Memory loop	Guests return for photos/videos.	Post-event gallery views.
Vendor loop	Vendors promote Wambe to clients.	Vendor-sourced events.
Discovery loop	Users browse public events.	Weekly active browsers and ticket conversion.

Retention should be measured differently by user type. Guests may not use Wambe weekly until discovery launches. Hosts may use it around life events. Vendors and planners should become the most frequent professional users.

25. Technical Architecture for Abdullah

Build modularly: event core first, payment and AI as services, marketplace later.

Recommended build approach: start with a responsive web app/PWA and a clean backend API. This allows any guest to open a link without downloading an app. Native mobile apps can come later for hosts, scanners, planners and repeat users.

Layer	Recommendation
Frontend	Next.js or React PWA for fast link access; React Native/Flutter later if native apps are needed.
Backend	Node.js with NestJS or Express; modular services for events, guests, passes, payments and media.
Database	PostgreSQL for relational event/guest/pass/payment data.
Storage	Cloud object storage for invitation cards, Aso-Ebi images and generated media.
Maps	Google Maps API initially; store coordinates to avoid repeated geocoding.
Payments	Paystack first for Nigerian cards, transfer and USSD; Flutterwave optional for broader reach.
QR service	Generate signed tokens and store pass state.
AI service	Separate microservice or serverless worker for fabric image generations.
Analytics	Event-level analytics table plus product analytics tool.
Admin	Internal dashboard for event review, user support, fraud and vendor verification.

Architecture principle: do not build the AI feature inside the core event service. Keep it separate so image generation cost, latency and failures do not affect event page reliability.

26. Suggested API and Database Scope

The first engineering goal is reliability, not over-engineering.

Below is a simple MVP endpoint map. Abdullah can translate this into an implementation plan and schema. The aim is to keep the core services clear enough for rapid development while leaving room for future marketplace and AI modules.

Endpoint group	Examples
Auth	POST /auth/request-otp, POST /auth/verify, GET /me
Events	POST /events, GET /events/:slug, PATCH /events/:id, POST /events/:id/publish
Guests	POST /events/:id/rsvp, GET /events/:id/guests, PATCH /guests/:id/approve
Passes	POST /guests/:id/pass, GET /passes/:token, POST /passes/:token/scan
Media	POST /media/upload, GET /media/:id
Dress code	POST /events/:id/dress-code, PATCH /dress-code/:id
Payments	POST /events/:id/tickets, POST /checkout, POST /webhooks/paystack
AI Studio	POST /asoebi/generate, GET /asoebi/jobs/:id
Admin	GET /admin/events, PATCH /admin/events/:id/status

Security basics: signed QR tokens, rate limits, role-based access, payment webhook verification, image file validation, audit logs for pass scans and admin actions, and strict privacy settings for private events.

27. Product Analytics and KPIs

Measure whether Wambe is becoming a habit and a business.

The first analytics dashboard should answer: Are hosts creating events? Are guests opening and RSVPing? Are event links spreading? Are hosts willing to pay? Are guests becoming hosts? Are vendors getting leads?

Funnel stage	Metric
Acquisition	Landing page visits, event page visits, referral source, WhatsApp share clicks.
Activation	Events created, event completion rate, time to publish, invitation uploads.
Guest engagement	Unique guests per event, RSVP rate, map click rate, pass download rate.
Monetization	Paid conversion rate, ARPA per event, ticket GMV, take-rate revenue.
Retention	Repeat hosts, planner accounts, vendor renewals, public discovery repeat visits.
Virality	Guests who become hosts, shares per event, event views per host.
Trust	Pass scan success, rejected scans, reported events, refund rate.

North Star Metric recommendation: Published events with at least 10 guest views. This avoids vanity metrics and focuses on events that are actually shared.

28. Trust, Safety and Fraud Controls

A celebration platform must protect hosts, guests and vendors.

Trust issues can include fake public events, duplicate tickets, vendor fraud, unauthorized event pages, spam, privacy violations and unsafe meetups. Wambe should have basic trust controls from day one, even before advanced systems are built.

Risk	Control
Fake public event	Manual review for featured events, host verification, report button.
Ticket fraud	Unique QR tokens, one-scan validation, webhook-confirmed payments.
Private information leakage	Hidden location mode, guest approval, no search indexing for private pages.
Vendor fraud	Verification, reviews, limited early marketplace supply.
Spam event creation	Rate limits, phone verification for publishing many events.
Image misuse	Image moderation, consent rules, clear deletion option.
Payment disputes	Clear refund policy and transaction logs.

For AI fashion features, Wambe should define consent rules clearly. Guests must know how their uploaded images are used, stored and deleted. The safest V1 is avatar-based generation rather than personalized human-photo previews.

29. Product Roadmap

Move from invitation utility to celebration ecosystem in phases.

The roadmap should protect speed. Wambe should not attempt marketplace, native apps, ticketing, AI, wallet passes and discovery all at once. The phased approach below keeps the launch realistic.

Phase	Timeline	Scope
Phase 0	Weeks 1-2	Brand, landing page, clickable prototype, data model, first planner interviews.
Phase 1	Weeks 3-10	MVP: event creation, invitation upload, maps, RSVP, sharing, dashboard.
Phase 1.5	Weeks 11-14	QR passes, host scanner, private approval, premium page payment.
Phase 2	Months 4-6	Ticketing, public event listings, city discovery, featured events.
Phase 3	Months 7-12	Aso-Ebi Studio beta, photo memory vault, planner accounts.
Phase 4	Year 2	Vendor marketplace, venue discovery, subscriptions, corporate accounts.
Phase 5	Year 3	Pan-African expansion, deep AI fashion, registry, financing partnerships.

Launch discipline: the first public version should be usable by a real couple planning a wedding and a real person hosting a birthday. If those two use cases work, Wambe has a foundation.

30. First 90-Day Execution Plan

A practical plan for Ammar and Abdullah.

Period	Product	Growth	Validation
Days 1-15	Clickable prototype, landing page, event-page design system.	Interview 20 hosts/planners/vendors.	Validate top pains and willingness to pay.
Days 16-30	Build event create/view flow, media upload, maps.	Recruit first 10 pilot events.	Measure event creation friction.
Days 31-45	Add RSVP, guest list and share previews.	Support pilots manually.	Track views, RSVP, map clicks.
Days 46-60	Add QR passes and host dashboard.	Convert 3-5 events to paid premium.	Test pricing and gate use.
Days 61-75	Improve design, analytics and private modes.	Create social proof content.	Collect testimonials and screenshots.
Days 76-90	Prepare beta launch and ticketing plan.	Onboard planners/photographers.	Decide next build: ticketing or AI beta.

The first 90 days should focus on real events, not perfection. A manual concierge approach is acceptable: help hosts set up pages, gather feedback, and identify what users repeatedly ask for.

31. Team and Operating Model

Wambe needs product, engineering, growth and operations - not just code.

The founding team can begin lean. Ammar owns product strategy, research, partnerships, GTM and investor narrative. Abdullah owns engineering architecture, build execution and technical roadmap. The next critical capability is design because Wambe must look premium and social. Growth/ops becomes important once pilot events start.

Role	Initial responsibility
Product & Strategy Lead	Vision, roadmap, user research, pricing, partnerships, investor documentation.
Engineering Lead	Architecture, backend, frontend, integrations, deployment and security.
Product Designer	Event page UI, host dashboard, mobile UX, brand system.
Growth Lead	Event acquisition, planner partnerships, campus ambassadors, social proof.
Operations/Support	Host onboarding, guest issues, event verification and vendor onboarding.
AI/ML Engineer later	Aso-Ebi generation pipeline, safety controls, model evaluation.

Early hiring should be milestone-based. Do not hire for the future before validating event creation, sharing and paid conversion.

32. Fundraising Narrative

The strongest investor story: Wambe owns the social and commercial graph of celebrations.

The investor narrative should not be “we are building an events app.” It should be: Wambe is building the digital infrastructure for Africa’s celebration economy. The platform starts with invitations and grows into payments, access, vendors, fashion and memories.

The pitch should emphasize cultural specificity, viral distribution, monetization layers and timing. Every event can bring hundreds of users. Every host has vendor needs. Every vendor wants demand. Every public event can use ticketing. Every guest may become a future host. This gives Wambe multiple compounding loops.

Investor question	Answer
Why now?	Mobile sharing, digital payments, maps and AI are mature enough for this product.
Why Wambe?	Culturally-specific workflows around Owambe, Aso-Ebi, invitations, passes and vendors.
How do you acquire users?	Event links spread to guests; partnerships drive event supply.
How do you make money?	Premium pages, QR passes, ticketing, marketplace, AI, registry and ads.
What is the moat?	Event graph, vendor network, trust data, local brand and culture-specific UX.
What is the risk?	Execution and adoption; mitigated by focused MVP and pilot events.

33. Key Risks and Mitigation

The idea is strong, but execution risk is real.

The biggest risk is not whether events exist. They clearly do. The biggest risk is whether hosts will change behavior from WhatsApp and flyers to Wambe. To overcome this, Wambe must be both easier and more beautiful than current behavior.

Risk	Why it matters	Mitigation
Adoption friction	Hosts may continue using WhatsApp only.	Make Wambe links WhatsApp-native; no forced guest app install.
Empty discovery feed	Public event users churn if there is no supply.	Delay broad discovery until supply exists.
Overbuilding	Too many features slow launch.	MVP discipline: invitation, RSVP, map, pass.
Payment trust	Users may worry about ticket or registry payments.	Use trusted processors, clear receipts, refund rules.
Vendor quality	Bad vendors can hurt Wambe brand.	Curate early vendors and reviews.
AI cost	Image generation may become expensive.	Paid AI packs and generation limits.
Privacy issues	Private events may expose sensitive location info.	Visibility modes, hidden location and approval controls.

34. Decision Checklist Before Build

Ammar and Abdullah should align on these choices before coding too deeply.

- Launch as web/PWA first, not native-only.
- Allow guests to view event pages without creating accounts.
- Start with private celebrations before public discovery.
- Include Aso-Ebi upload in MVP, but release AI Studio later.
- Monetize QR pass and premium controls before complex marketplace.
- Use WhatsApp sharing as the primary distribution mechanism.
- Keep event privacy modes simple and clear.
- Track analytics from day one.
- Avoid building vendor marketplace before proving event volume.
- Design must be premium, joyful and mobile-first.

Suggested immediate next step: create a Figma prototype covering host creation, guest page, RSVP, QR pass and host dashboard. Test it with five real hosts before finalizing backend schema.

35. Appendix A - Product Requirements Summary

A compact PRD Abdullah can use to scope implementation.

Module	Requirement
Event creation	Create/edit/publish/unpublish event; generate unique slug.
Media upload	Upload invitation card and Aso-Ebi images; create thumbnails.
Guest RSVP	Guests submit RSVP; host views list and exports.
Maps	Store venue, address, lat/lng; one-tap directions.
Passes	Generate QR code per approved guest; scan and validate.
Privacy	Public/private/invite-only/hidden location modes.
Payments	Premium page purchase and later ticketing.
Notifications	Basic email/SMS/WhatsApp sharing links; in-app later.
Analytics	Event views, RSVP, map clicks, shares, scans.
Admin	Moderate public events, manage reports and users.

Non-functional requirements: fast mobile load, secure QR tokens, scalable media storage, payment webhook reliability, image file validation, backup strategy and admin audit logs.

36. Appendix B - Sources and Research Notes

The research below informs the paper; all market-sizing estimates remain internal assumptions until validated with Wambe data.

ID	Source note
S1	6Wresearch - Nigeria Event Management Market: growth drivers include weddings/personal celebrations and increasing event-management demand.
S2	BusinessDay Nigeria - reports high levels of event-industry activity in Lagos and Abuja and need for more operational structure.
S3	Connect Nigeria - 2026 article on wedding planner fees in Nigeria, with ranges for 100-200 and 500-guest weddings.
S4	SNS Insider - 2026 global event-industry market report estimating large global event-market value and CAGR through 2035.
S5	Technavio - event industry market forecast highlighting technology integration and AI as drivers.
S6	Maximize Market Research / Market Reports World - global wedding services/planning market reports.
S7	Partiful official pages - free online invitations, RSVP tracking, text blasts, photo albums and ticketing.
S8	Luma official/help pages - event pages, invitations, reminders, ticketing, discovery and check-in.
S9	Eventbrite official organizer pages - ticketing, organizer tools, check-in, attendance tracking and payments.
S10	Techpoint Africa brand press on Guestsnhost - evidence of Nigerian invitation/ticketing startups attempting similar infrastructure.

Research caution: several event-market websites provide broad estimates that are useful for context but not sufficient for investor-grade precision. Wambe should validate its own market with pilot-event data: number of guests per event, share rate, RSVP rate, paid conversion and vendor lead conversion.

37. Closing Vision

Wambe can become the cultural technology layer behind African celebration.

The opportunity is powerful because Wambe sits on top of a behavior that already exists. Nigerians already celebrate. Hosts already invite. Guests already ask for location. Vendors already compete for event budgets. Wambe's job is to organize this reality into a beautiful, trusted and monetizable platform.

The disciplined path is clear: start with digital invitations, RSVP, maps and passes. Win real weddings and birthdays. Use the viral loop from guests. Add ticketing for public events. Build Aso-Ebi Studio as a differentiated premium experience. Then open the vendor marketplace once the platform has demand.

If Wambe executes well, it can become more than an event app. It can become the default digital home for celebrations across Nigeria and eventually Africa.

Final product statement:

Wambe - every celebration deserves a digital home.
